

PROP BAN-AVOIDANCE PLAYBOOK

Operational Security Protocols for Running the Ghost System

1. Objective

This playbook outlines the required operational-security (OPSEC) procedures to prevent prop firms from detecting, flagging, or banning accounts that use the Ghost Protocol hedging engine.

Your goal is simple:

Never allow the prop firm to establish behavioral, execution, IP, or platform-based correlations between your prop account and your personal hedge account.

2. Core Threats

Prop firms ban traders for reasons that have **nothing to do with profitability**, including:

2.1. Mirrored Trade Patterns

- Identical entries/exits on multiple accounts
- Opposite direction hedges executed with perfect timing
- Same SL/TP distances
- Repeated identical trade sequences

2.2. Device/Network Fingerprinting

- Same IP address used across prop + personal accounts
- Same device ID / browser fingerprint
- VPN patterns that match known datacenter IP blocks

2.3. Behavioral Anomalies

- Passing phases in single trades
- Consistent RR > 4–6R
- Account hits max daily loss often
- Extremely low drawdown followed by a large one-trade profit

2.4. Platform Telemetry

Most prop firms log:

- Chart indicators
- EA/script usage
- Copy-trading signatures
- Hotkey execution patterns
- Time-in-trade statistics

Avoid letting anything match between prop and personal accounts.

3. Mandatory OPSEC Rules

3.1. Network Separation

You MUST separate prop accounts and personal hedge accounts using:

- ✓ **Physical device separation** (best)
 - ✓ **Mobile hotspot on prop, WiFi on personal**
 - ✓ **Residential VPN for one side**
 - ✗ NEVER use datacenter VPNs
 - ✗ NEVER use the same connection for both accounts
-

3.2. Device Isolation

Ideal setup:

Device A → Prop accounts only

Device B → Personal hedge account

Hard rules:

- Do NOT log into prop and personal accounts on the same device
 - Do NOT screen-mirror or remote-connect between them
 - Do NOT reuse browser profiles
 - Clear cookies + cache on the prop device monthly
-

3.3. Execution Desynchronization

Your execution must NOT be perfectly mirrored in time.

Apply these rules:

- Offset hedge entries by **+50ms to +500ms**
- Use **different SL/TP sizes** (still mathematically equivalent)
- Use **different lot size decimal precision**
 - Prop: 3 decimals
 - Personal: 2 decimals

Example:

Prop → 1.237 lots

Personal → 0.94 lots

3.4. Broker + Platform Isolation

Use **completely different brokers** between prop + personal.

Prop (example): MFFX, The Funded Trader, TFT

Personal (example): IC Markets, Pepperstone, TMGM

Avoid:

- Trading the same session times daily
- Opening trades at the same candle timestamp

4. Passing Phases Without Suspicion

✓PASSING PHASE 1 SAFELY

- Add **1–2 small warm-up trades** before your actual Phase 1 pass
- Reduce RR slightly (e.g., 4R–6R instead of 10R)
- Occasionally close trades early at +0.5R or 1R

✓PASSING PHASE 2 SAFELY

- Do NOT do it in one trade
- Hit partial profits
- Take at least **2–4 trades** before the final pass

✓FUNDED ACCOUNT APPEARANCE

To avoid prop-firm bots:

Simulate human behavior

- Random trade times
- Random SL adjustments (even meaningless ones)
- Close partials at random levels
- Add “scratch trades” (0.1R–0.2R losses or wins)

5. The “Humanization Layer”

Adding randomness protects you.

Required:

- Vary your stop placement by 2–8 pips

- Enter trades early or late by random intervals
- Make 1–3 trades per week that are purposely small

Optional but Powerful:

- Use different chart templates
- Use different indicators on the personal account (even fake ones)
- Change SL/TP placement visually

All actions should look unrelated between accounts.

6. Communication & Metadata Safety

NEVER:

- ✗ Never mention hedging in tickets or emails
- ✗ Never upload screenshots that show both accounts
- ✗ Never ask support “why was I banned?”
- ✗ Never admit using opposite trades

Prop firms share ban-lists. One slip = all future accounts flagged.

7. Funding/Payout Safety

Payout Receipts

- Do NOT upload payout proofs publicly
- Do NOT show MT5 screenshots that reveal pattern duplication
- Blur ticket IDs, time stamps, and trade lists

Bank/PayPal Transfers

- Use different names if possible

- Avoid linking personal hedge profits directly to prop payouts via the same bank
-

8. Identifying When a Prop Firm Is Watching You

Warning signs:

- Trades take longer to fill
- Support asks unusual questions
- Your risk manager contacts you
- Account verification requests increase
- Spreads widen only for you

If any of these happen → **stop trading the account immediately.**

9. Universal Ghost Protocol Safety Checklist

BEFORE TAKING ANY PROP TRADE:

- ✓ Network isolated
- ✓ Timing offset enabled
- ✓ Lot sizes not too “perfect”
- ✓ Personal hedge TP matches prop SL (not visually, only mathematically)
- ✓ Prop SL/TP placed visually differently
- ✓ 1–2 fake warm-up trades executed

BEFORE TAKING A PAYOUT:

- ✓ Ensure your hedge size is correct
 - ✓ Log out of all personal accounts
 - ✓ Avoid any precise mirrored entries
-

10. Final Mission Directive

The prop firm must believe:

You are just a high-variance, high-risk trader with a lucky streak.

Never give them anything to correlate, detect, or flag.

Follow this playbook and:

- Your accounts survive longer
 - Your payouts look normal
 - Your hedge remains invisible
 - And the Ghost Protocol stays undetectable
-
